

10.Elementary data structures

Yu-Shuen Wang, CS, NCTU

10.1 Stacks and queues

Stacks and queues are dynamic set in which element removed from the set by the DELETE operation is prespecified. In a **stack** the element deleted from the set is the one most recently inserted; the stack implements a ***last-in, first-out***, or **LIFO**, policy. Similarly, in a **queue**, the element deleted is implements a ***first-in, first-out***, or **FIFO**, policy.

An array implementation of a stack S

(a)

(b)

(c)

- empty, underflows, overflows

STACK_EMPTY(S)

```
1  if  $top[S] = 0$   
2      then return TRUE  
3      else return FALSE
```

PUSH(S, x)

- 1 $top[S] \leftarrow top[S] + 1$
- 2 $S[top[S]] \leftarrow x$

POP(S)

- 1 if STACK-EMPTY(S)
- 2 then error “underflow”
- 3 else $top[S] \leftarrow top[s] - 1$
- 4 return $S[top[S] + 1]$

An array implementation of a queue Q

ENQUEUE(Q, S)

```
1  $Q[tail[Q]] \leftarrow x$   
2 if  $tail[Q] = length[Q]$   
3   then  $tail[Q] \leftarrow 1$   
4   else  $tail[Q] \leftarrow tail[Q] + 1$ 
```

DEQUEUE(Q)

```
1  $x \leftarrow Q[\text{head}[Q]]$   
2 if  $\text{head}[Q] = \text{length}[Q]$   
3   then  $\text{head}[Q] \leftarrow 1$   
4   else  $\text{head}[Q] \leftarrow \text{head}[Q] + 1$   
5 return  $x$ 
```

10.2 Linked lists

LIST_SEARCH(L, k)

```
1  $x \leftarrow head[L]$   
2 while  $x \neq \text{NIL}$  and  $key[x] \neq k$   
3   do  $x \leftarrow next[x]$   
4 return  $x$ 
```

$O(n)$

LIST_INSERT(L, x) at front

- 1 $next[x] \leftarrow head[L]$
- 2 **if** $head[L] \neq \text{NIL}$
- 3 **then** $prev[head[L]] \leftarrow x$
- 4 $head[L] \leftarrow x$
- 5 $prev[x] \leftarrow \text{NIL}$

$O(1)$

LIST_DELETE(L, x)

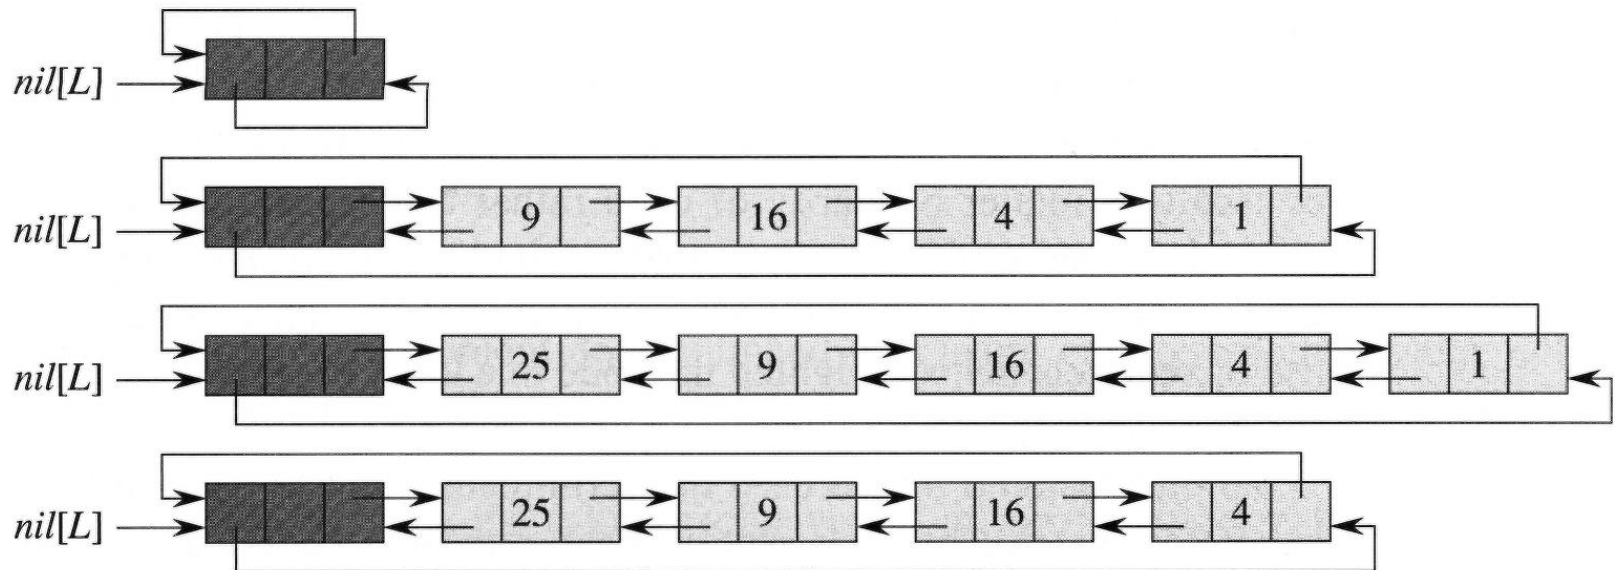

- (Call LIST_SEARCH first $O(n)$)

```
1  if  $prev[x] \neq \text{NIL}$   
2      then  $next[prev[x]] \leftarrow next[x]$   
3      else  $head[L] \leftarrow next[x]$   
4  if  $next[x] \neq \text{NIL}$   
5  then  $prev[next[x]] \leftarrow prev[x]$ 
```

$O(1)$ or $O(n)$

A **Sentinel** is a dummy object that allows us to simplify boundary conditions,

LIST_DELETE'(L,x)

1 $next[prev[x]] \leftarrow next[x]$

2 $prev[next[x]] \leftarrow prev[x]$

LIST_SEARCH'(L,k)

```
1  $x \leftarrow next[nil[L]]$   
2 while  $x \neq nil[L]$  and  $key[x] \neq k$   
3   do  $x \leftarrow next[x]$   
4 return  $x$ 
```

LIST_INSERT'(L,x)

- 1 $next[x] \leftarrow next[nil[L]]$
- 2 $prev[next[nil[L]]] \leftarrow x$
- 3 $next[nil[L]] \leftarrow x$
- 4 $prev[x] \leftarrow nil[L]$

11.3 Implementing pointers and objects

- A multiple-array representation of objects

A single array representation of objects

Allocating and freeing objects--garbage collector

(a)

Allocate_object(), LIST_INSERT(L,4),Key(4)=25

(a)

(b)

ALLOCATE_OBJECT()

```
1 if  $free = \text{NIL}$ 
2   then error “out of space”
3   else  $x \leftarrow free$ 
4        $free \leftarrow next[x]$ 
5   return  $x$ 
```

LIST_DELETE(L,5), FREE_OBJECT(5)

FREE_OBJECT(x)

1 $next[x] \leftarrow free$

2 $free \leftarrow x$

Two link lists

<i>free</i>	10		1	2	3	4	5	6	7	8	9	10
L_2	9	<i>next</i>	5	/	6	8	/	2	1	/	7	4
		<i>key</i>	k_1	k_2	k_3		k_5	k_6	k_7		k_9	
L_1	3	<i>prev</i>	7	6	/		1	3	9		/	

10.4 Representing rooted trees

Binary trees

Rooted tree with unbounded branching
